Degree in Information Technology

Introduction

GFE (Gig For Everyone) is a local gig marketplace web application. It connects clients who need help with daily tasks such as cleaning, childcare, and elderly care with local jobseekers.

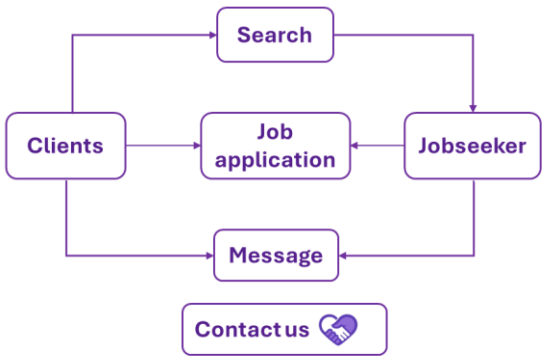

FIGURE 1. System Flow of GFE

Objectives

The main objectives of the project were to implement user registration and login with role-based access, enable jobseeker profile creation, support job posting and browsing, develop a job application system, facilitate messaging between users, and provide a contact form for user support.

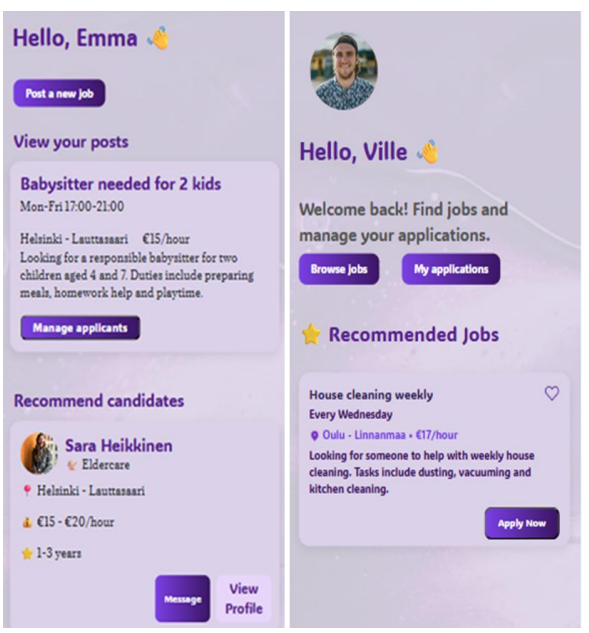

FIGURE 2. Client and Jobseeker dashboards

Methods

The application was developed using JavaScript, Node.js, Express, and PostgreSQL. The frontend was implemented with HTML, CSS, and Bootstrap 5. Authentication was handled using JWT and bcrypt. GitHub was utilized for version control and project management. Figma was used for interface design (see Figures 3 and 4).

FIGURE 3. Architecture client - server - database

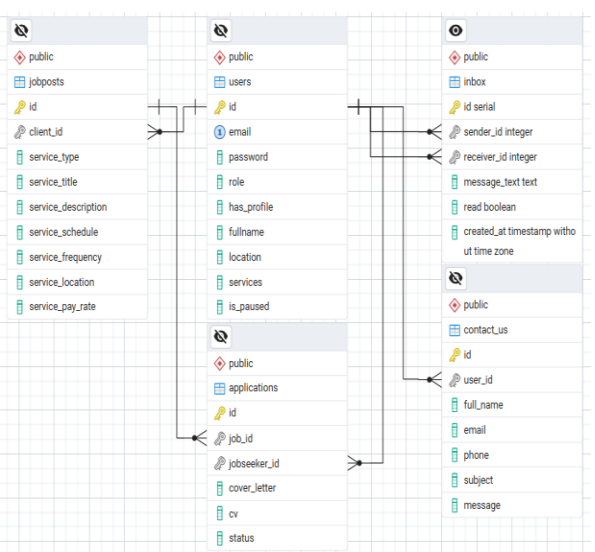

FIGURE 4. Database Design Of GFE

Results

A functional web application was developed. Users can register as either clients or jobseekers. Jobseekers are able to browse, save, and apply for jobs, while clients can create and manage job postings. The system also includes a messaging feature for direct communication and a contact form for user support. The system interfaces are illustrated in Figure 5.

Conclusion

The GFE application was successfully completed and met the course requirements. Practical experience was gained in frontend and backend development, database design, APIs, and teamwork using Git. Future improvements could include more jobs, better security, verification features, and a mobile app.
